Python ANCP (RFC 6320) client and library.

PyANCP requires Python 2.7 or later, or Python 3.2 or later.

State: **BETA**

ANCP Library Example:

```
from ancp.client import Client
from ancp.subscriber import Subscriber

# setup ancp session
client = Client(address="1.2.3.4")
if client.connect():
    # create ancp subscribers
    S1 = Subscriber(aci="0.0.0.0 eth 1", up=1024, down=16000)
    S2 = Subscriber(aci="0.0.0.0 eth 2", up=2048, down=32000)
    # send port-up for ancp subscribers
    client.port_up([S1, S2])
    # keep session active
    try:
        while client.established.is_set():
            time.sleep(1)
    except KeyboardInterrupt:
        # send port-down for ancp subscribers
        client.port_down([S1, S2])
        client.disconnect()
```

Contents:

CHAPTER 1

ANCP Client

Currently there is just an example (`bin/client.py`) which shows how to use the client library. An ANCP client is planned for future releases.

CHAPTER 2

ANCP Client Library

The client library allows to setup and control sessions to an ANCP server.

2.1 Session Setup

Following an example of how to create an ANCP session.

```
from ancp.client import Client

client = Client(address="1.2.3.4")
client.connect()
```

Warning: IPv6 is currently not supported!

It is also possible to specify the source address and destination port (default 6068). The default tech type is *DSL* which can be changed to *ANY* or *PON*. The argument *timer* (default 25 seconds) specifies the interval of periodically adjacency messages to monitor the session.

```
from ancp.client import Client
from ancp.client import TechTypes

client = Client(address="1.2.3.4", source_address="1.2.3.5", port=6068
                tech_type=TechTypes.DSL, timer=25.0)
client.connect()
```

The *connect* method creates a TCP session and starts a background thread which responds to messages from the server and generates periodically adjacency messages (*timer*).

Following an example which shows how to keep a session active until *KeyboardInterrupt*.

```
try:
    while client.established.is_set():
        time.sleep(1)
except KeyboardInterrupt:
    client.disconnect()
```

The `disconnect` method send an *ANCP RSTACK* message to the server, waits up to 1 seconds for response and closes TCP session.

2.2 ANCP Subscriber

ANCP subscribers are requires to generate *Port Up/Down Messages*.

```
from ancp.subscriber import Subscriber

S1 = Subscriber(aci="0.0.0.0 eth 1", up=1024, down=16000)
```

All supported line attributes are described in `ancp/subscriber.py`. The argument `aci` is mandatory. Attributes can be updated (e.g. `S1.up=1000`) or removed (e.g. `S1.up=None`).

2.3 Port Up/Down Messages

It is possible to send multiple port up/down in a single TCP message.

```
# create ancp subscribers
S1 = Subscriber(aci="0.0.0.0 eth 1", up=1024, down=16000)
S2 = Subscriber(aci="0.0.0.0 eth 2", up=2048, down=32000)
S3 = Subscriber(aci="0.0.0.0 eth 3", up=2048, down=32000)

# send single port up message
client.port_up(S1)

# send multiple port up in a single tcp message
client.port_up([S2, S3])
```

The `port_down` method behaves similar to `port_up`.

It is also possible to update line attributes without sending a port down message.

```
# create ancp subscribers
S1 = Subscriber(aci="0.0.0.0 eth 1", up=1024, down=16000)

# send single port up message
client.port_up(S1)

# change line attributes and send port up
S1.up=768
S1.down=14000
client.port_up(S1)

# send port up again
client.port_up(S1)
```

CHAPTER 3

Code Documentation

3.1 ancp

Python ANCP Client

3.2 ancp/client.py

ANCP Client

Copyright (C) 2017-2021, Christian Giese (GIC-de) SPDX-License-Identifier: MIT

```
class ancp.client.AdjacencyState

    ESTAB = 4
    IDLE = 1
    SYNRCVD = 3
    SYNSENT = 2

class ancp.client.Capabilities
```

```
    OAM = 4
    TOPO = 1

class ancp.client.Client (address, port=6068, tech_type=5, timer=25.0, source_address=None)
    ANCP Client
```

Parameters

- **address** (*str*) – ANCP server address (IPv4)
- **port** (*int*) – ANCP port (default: 6086)

- **tech_type** (`ancp.client.TechTypes`) – tech type (default=DSL)
- **timer** (`int`) – adjacency timer (default=25.0)
- **source_address** (`str`) – optional source address

```
connect()
disconnect (send_ack=False)
port_down (subscribers)
    send port-down message
For backwards compatibility single value ANCP subscribers are accepted.

Parameters subscriber ([ancp.subscriber.Subscriber]) – collection of ANCP
subscribers

port_up (subscribers)
    send port-up message
For backwards compatibility single value ANCP subscribers are accepted.

Parameters subscriber ([ancp.subscriber.Subscriber]) – collection of ANCP
subscribers
```

```
class ancp.client.MessageCode

ACK = 3
RSTACK = 4
SYN = 1
SYNACK = 2

class ancp.client.MessageType

ADJACENCY = 10
ADJACENCY_UPDATE = 85
PORT_DOWN = 81
PORT_MANAGEMENT = 32
PORT_UP = 80

class ancp.client.ResultCodes

NoResult = 0

class ancp.client.ResultFields

AckAll = 2
Failure = 4
Ignore = 0
Nack = 1
Success = 3
```

```
class ancp.client.TechTypes

    ANY = 0
    DSL = 5
    PON = 1

    ancp.client.tomac(v)
        Tuple to MAC Address

        Parameters v (tuple) – MAC address
        Returns MAC address
        Return type str
```

3.3 ancp/subscriber.py

ANCP Subscribers

class ancp.subscriber.LineState
    Line States

    IDLE = 2
    SHOWTIME = 1
    SILENT = 3

class ancp.subscriber.Subscriber(aci, **kwargs)
    ANCP Subscriber

    Parameters
        • aci (str) – Access-Loop-Circuit-ID
        • ari (str) – Access-Loop-Remote-ID
        • aaci_bin (int or tuple) – Access-Aggregation-Circuit-ID-Binary
        • aaci_ascii (str) – Access-Aggregation-Circuit-ID-ASCII
        • state (ancp.subscriber.LineState) – DSL-Line-State
        • up (int) – Actual-Net-Data-Rate-Upstream
        • down (int) – Actual-Net-Data-Rate-Downstream
        • min_up (int) – Minimum-Net-Data-Rate-Upstream
        • min_down (int) – Minimum-Net-Data-Rate-Downstream
        • att_up (int) – Attainable-Net-Data-Rate-Upstream
        • att_down (int) – Attainable-Net-Data-Rate-Downstream
        • max_up (int) – Maximum-Net-Data-Rate-Upstream
        • max_down (int) – Maximum-Net-Data-Rate-Downstream
        • dsl_type (ancp.subscriber.DslType) – DSL-Type
        • data_link (ancp.subscriber.DataLink) – Access-Loop-Encapsulation - Data Link
        • encap1 (ancp.subscriber.Encap1) – Access-Loop-Encapsulation - Encapsulation 1
        • encap2 (ancp.subscriber.Encap2) – Access-Loop-Encapsulation - Encapsulation 2

    aaci_bin
    tlvs

class ancp.subscriber.TLV(t, val)
```

```
len
off
type
val

class ancp.subscriber.TlvType
    TLV Types

    AACI_ASCII = 3
    AACI_BIN = 6
    ACC_LOOP_ENC = 144
    ACI = 1
    ARI = 2
    ATT_DOWN = 134
    ATT_UP = 133
    DOWN = 130
    LINE = 4
    MAX_DOWN = 136
    MAX_UP = 135
    MIN_DOWN = 132
    MIN_UP = 131
    STATE = 143
    TYPE = 145
    UP = 129

ancp.subscriber.access_loop_enc(data_link, encap1, encap2)
    Create the Access Loop Tlv
```

Parameters

- **data_link** ([ancp.subscriber.DataLink](#)) – The Data link type
- **encap1** ([ancp.subscriber.Encap1](#)) – The first Encapsulation type
- **encap2** ([ancp.subscriber.Encap2](#)) – The second Encapsulation type

Return type *TLV*

```
ancp.subscriber.mktlvs(tlvs)
```
